Leading Investment Firm Takes Decision-Making From Milliseconds to Microseconds

In an industry where making decisions quickly leads to competitive advantage, a large European investment firm needed to enhance and accelerate its core decision-making applications. With help from Dell EMC and Intel, the organization built an innovative end-to-end non-volatile memory express (NVMe) storage platform to support real-time analytics for mission-critical decision-making applications. The Dell EMC PowerMax solution, with Intel® Optane™ SSDs, has increased reliability while reducing transaction time from milliseconds to microseconds.¹ The enhanced performance and reliability of the new storage platform means the organization's core applications are able to perform significantly more transactions per day. Meanwhile, the consolidated solution has helped shrink the organization's storage footprint and related costs.
