AWS Local Zones

RUN LATENCY-SENSITIVE APPLICATIONS AT THE EDGE USING AWS INFRASTRUCTURE AND SERVICES

LOW LATENCY

Extends AWS infrastructure services, APIs, and tools to where customers need it to support low-latency applications

FULLY MANAGED

Fully owned, managed, and supported by AWS

CITIES

New type of AWS infrastructure that places AWS compute, storage, networking, and select AWS services closer to where your end users are located

AWS Outposts

AWS INFRASTRUCTURE AND SERVICES IN YOUR ON-PREMISES LOCATION

AWS DESIGNED

Same AWS-designed infrastructure as in AWS data centers (built on AWS Nitro System)

FULLY MANAGED

Fully managed, monitored, and operated by AWS as if in AWS Regions

AWS API

Single pane of management in the cloud providing the same APIs and tools as in AWS Regions

Broadest and deepest platform choice

CATEGORIES

General purpose

Burstable

Compute intensive

Memory intensive

Storage (High I/O)

Dense storage

GPU compute

Graphics intensive

CAPABILITIES

Choice of processor

Fast processors (up to 4.5 GHz)

High memory footprint (up to 24 TiB)

> Instance storage (HDD and NVMe)

Accelerated computing (GPUs, ASICs, Video, FPGAs)

> Networking (up to 800 Gbps)

Bare metal

Size (Nano to 112xlarge) OPTIONS

Amazon EBS

Amazon Elastic Inference

MORE THAN

600 INSTANCE TYPES

for virtually every workload and business need

Greatest variety and availability to meet your global workload needs

350+ Intel instances

16 years of partnership

General purpose T3 | M6i | M6in **Compute-optimized** C6i | C6in | Hpc6id Storage-optimized

Memory-optimized R7iz | R6i | R6in | X2idn / X2iedn | Z1d

Accelerated compute Gaudi Instances | P4 | G4dn | F1

2017

2023

The AWS Nitro System architecture

Offering strong security, performance, and innovation in the cloud

Nitro performance for real-world workloads

Amazon EC2 instances can deliver over 15% higher throughput performance

The Nitro System

Nitro Cards

aws

VPC Networking Amazon Elastic Block Store (Amazon EBS) Instance Storage System Controller

Nitro Security Chip

Integrated into motherboard Protects hardware resources Hardware Root of Trust

Nitro Hypervisor

Lightweight hypervisor Memory and CPU allocation Bare Metal-like performance

Innovating with Intel

16 YEARS OF COLLABORATION AND INNOVATION WITH AWS

Collaboration

Deep engineering collaboration across AWS portfolio

Extensive integration

Over 350 Amazon EC2 instances are powered by Intel processors

Fastest

Fastest processor in the cloud and widest selection of Ice Lake instances

Amazon EC2 C6id, M6id, and R6id instances

AVAILABLE NOW

NEW!

aws

EC2 instances powered by 3rd gen Intel Xeon Scalable processor and NVMe attached storage

- Equipped with up to 7.6 TB of local NVMe-based SSD block-level storage for workloads that needs access to high-speed, low-latency storage
- Deliver up to 15% better price performance compared to previous gen C5d, M5d, and R5d instances
- Up to 2x faster networking and 20% higher memory bandwidth
- Support for Total Memory Encryption (TME)
- Ideal for core computing workloads that need access to high-speed, low latency storage.

Amazon EC7 R7iz instances

PREVIEW

NEW!

High-frequency memory-optimized instances powered by 4th generation Intel Xeon Scalable processor

- Up to 128 vCPU, up to 1 TiB of memory to provide up to 2.6x more vCPU and memory compared to comparable high frequency instances
- Up to 20% higher performance when compared to comparable high frequency instances
- First x86-based EC2 instance to use DDR5 memory and deliver up to 2.4x higher mem bandwidth over comparable high frequency instances
- Designed for workloads such as front-end Electronic Design Automation (EDA), relational database workloads with high per-core licensing fees, and financial, actuarial, and data analytics simulation workloads

High performance computing (HPC)

Intel-based EC2 instances power the most computationally demanding applications in a cost-effective way at scale. Intel and AWS offer a comprehensive set of compute, networking, storage, and visualization technologies to give customers an ideal environment for HPC workloads. Coupled with an extensive partner ecosystem, customers are empowered to innovate more freely.

Workload	Instance family	Instance family	Best use cases	Notable features
	Compute networking performance	C6in	 Ideal choice for HPC workloads, data lakes Network appliances that can take advantage of improved network throughput and packet rate performance 	 Up to 200 Gbps network bandwidth 80 Gbps of EBS bandwidth EFA support on the 32xlarge and metal sizes
	Compute performance	C6i	 Optimized for compute-intensive workloads Deliver cost-effective high performance at a low price per compute ratio 	 AVX-512 4GB/core memory Intel Total Memory Encryption (TME)
HPC	Fastest compute	R7iz z1d M5zn	 R7iz and z1d targets both memory- and compute-intensive apps R7iz and z1d is ideal for EDA, gaming, and certain relational database workloads with high per-core licensing costs 	 High single-thread performance with sustained all core frequency up to 4.5 GHz z1d = 16 GiB/vCPU memory z1d has up to 1.8 TB of instance storage M5zn – up to 100 Gbps network bandwidth
	Balanced networking	M6i (+M6in, M6idn)	 General purpose instance that provides a balance of compute, memory, and network resources Good for many applications including web, application and gaming servers, and small to mid-size databases 	 8 GB/core memory Up to 200 Gbps network bandwidth (M6in) Up to 7.6 TB of instance storage

aws

Amazon EC2 Hpc6id instances

Best price performance for memory and data-intensive HPC workloads in Amazon EC2

200G networking with EFA

2x higher Elastic Fabric Adaptor performance over current generation HPC instances for increased application performance

Price performance benefits

Up to 2.2x better price-performance for data-intensive HPC workloads such as Finite Element Analysis (FEA) over comparable x86-based instances

Optimized for for data intensive HPC workloads

1TB of instance memory and 15.2 TB of NVMe storage to accelerate seismic, energy, and FEA workloads

Scale-Out Computing on AWS

aws

 \sim

Intel-based Amazon EC2 instances for ML

Second-generation Intel Xeon Scalable processor

DL boost for inference, single-node training

M5, C5 instances are suitable for all computer vision, ML, and DL inference workloads

R5 instances are for memory-intensive workloads that use 3D-CNN/BERT- large/T5 topologies with memory requirement more than 192 GB T3 instances are better suited for ML applications and low-compute DL inference applications

C5n instances are suitable for distributed deep learning training due to the high NW performance required for inter-node communication

Bare metal instances are preferred for large topologies such as HVM-based instances, which add ~10% performance overhead

aws

For more info, visit <u>https://aws.amazon.com/ec2/instance-types/</u>

Habana Gaudi-based instances – DL1

ML TRAINING POWERED BY NEW HABANA GAUDI PROCESSORS FROM INTEL

An Intel Company

New Amazon EC2 instances built specifically for ML training and powered by up to 8 new Habana Gaudi processors from Intel

Will deliver up to 40% lower cost to train deep learning models over GPU-based instances

Will allow customers to iterate and train models more frequently

Benefit from full stack of Amazon EC2 services – DL AMIs, DLC for containerized applications, ultimately Amazon SageMaker

Developers can implement Gaudibased instances via Amazon ECS and Amazon EKS for containerized applications Will support common frameworks like TensorFlow and PyTorch

Wide range of ML workloads for applications including NLP, image classification, object detection, and recommendation systems

For efficient scaling across multiple Gaudi-based Amazon EC2 instances, support for AWS Elastic Fabric Adapter

Resource optimization

Cost

Maximize value you derive from your spend

Performance

Ensure your provisioned capacity meets workload requirements

AWS Compute Optimizer

AWS Compute Optimizer

Identifies whether your AWS resources are optimal and offers recommendations to improve performance

Resource

Resource analysis

Use machine learning to analyze the current configuration of your resources, and their utilization data from Amazon CloudWatch, to generate recommendations

Cross-service integration Recommendations can be exported to Amazon S3 and are integrated with AWS Cost Explorer and AWS Systems Manager

Reconfigure resources

Use the recommendations to reconfigure your resources for cost reduction and performance improvements

Example: Amazon EC2 instances

M5.2xlarge

vCPU: 8 RAM: 32 GiB Instance storage: EBS only Network: Up to 10 Gbps Estimated monthly cost: \$280.32

- ~40% CPU utilization during the day
- ~10% CPU utilization during the night
- ~30% RAM usage throughput
- <1 Mbps network usage more than 99% of the time
- <2 IOPS more than 99% of the time

vCPU: 4 RAM: 16 GiB Instance storage: EBS only Network: Up to 10 Gbps Estimated monthly cost: \$140.16 Savings: 50.0% Risk: Low

T3.xlarge

M5.xlarge

vCPU: 4 RAM: 16 GiB Instance storage: EBS only Network: Moderate Estimated monthly cost: \$121.47 Savings: 56.7% Risk: Medium

R5.large

vCPU: 2 RAM: 16 GiB Instance storage: EBS only Network: Up to 10 Gbps Estimated monthly cost: \$91.98 Savings: 67.2% Risk: Medium

Continuous profiling and continuous optimization

• gProfiler

gProfiler

PRODUCTION PROFILING, MADE EASY

Low-overhead continuous production CPU profiling

php

- Free and open source
- SaaS and standalone deployments
- One of the first optimization-driven profilers
- Purpose-built for collaboration
- Wide runtime coverage:

Java

Optimization use case

Regex hogging CPU

		gProfiler process	
Background	Investigation	Optimization	Results
0	0	0	0
Deployment of new service	40% of CPU spent performing regex	Replace regex by finite state machine	CPU utilization of cluster drops from 50% to 25%
10-machine cluster	Regex is not CPU-efficient	Reduced CPU utilization	Cluster size decreased
gProfiler deployed on inception		from 40% to 9%	to 4 machines
